Correction to Interfacial Energy of Polypeptide Complex Coacervates Measured via Capillary Adhesion

Dimitrios Priftis, Robert Farina, and Matthew Tirrell*

Langmuir **2012**, *28*(23), 8721−8729. DOI: dx.doi.org/10.1021/la300769d

In this work on the interfacial energy of polypeptide complex coacervates, a series of poly(glutamic acid) polymers with different molecular weights were used. In numerous occasions throughout the article (e.g., Abstract, Introduction, and Experimental Section), these polymers were referred to as poly(L-glutamic acid sodium salt), implying that they were optically pure. After communication with the supplier (Alamanda Polymers, Inc.) and further characterization, it has come to our attention that these polymers were not optically pure (L) but contained a number of D repeating units and should therefore be referred to as poly(D,L-glutamic acid sodium salt). This recent realization of the racemic nature of the polyanions used does not affect any of the findings or the conclusions of this study.
