Correction to Figure 2: The x axis was incorrectly labeled with units of nL (where nL = nanoliter). The correct units should be ($\times 10^2$ pL) (where pL = picoliter) (i.e., the solder volume units on the x axis should be a factor of 10 smaller than that labeled in Figure 2 of the original article). The simulations used the proper value for the volume, and the change does not affect the discussion or conclusions but is important from a fabrication standpoint.
